

48-channel parallel optical module

Overview

The POB48 series parallel optical transceiver module is designed for defense communication command systems and subsystems, enabling bidirectional conversion between multi-channel electrical and optical signals. The module adopts a hermetically sealed micro-socket package structure, featuring a 48 channels, with possible other options. These cost-effective, high-capacity data “pipe” solutions are ideal for board to board, shelf to shelf and. We report here on the design, fabrication and characterization of 48-channel parallel optical transceivers demonstrating terabit/sec data transfer rate. 48 Tb/s receive throughput was achieved using a second-generation single-chip holey CMOS transceiver IC. Parallel optics are widely used in HPC data centers, including MMF series and SMF series.
