

Barrier measures for optical cables and electrical cables are

Overview

Safety barriers (also known as Zener barriers) are used to connect intrinsically safe circuits (Ex i) and non-intrinsically safe circuits, such as Ex i field devices with automation systems. They can process standard signals such as 4 to 20 mA, as well as less common ones. Fiber optic cables enable high-speed, long-distance data transfer, forming the backbone of modern communication. Yet, outdoors, they face temperature swings, moisture, UV exposure, rodents, and human interference. Protecting them is essential for long-term reliability. This guide covers how to. Shielding protects your systems against electromagnetic interference and other sources of interference while also protecting the environment against emitted interference.
