

Cable tray length converted to mass

Overview

This tool estimates tray self-weight from material density and an approximate metal volume. For solid and perforated trays, it treats the tray as a formed sheet:
Developed sheet width per meter: $Dev = W + 2H + 2R$ Metal volume per meter: $V = Dev \times t \times 1 \times (1 - Open\%)$ Weight per meter: $kg/m = V \times \rho$. Calculate cable tray fill ratio, weight loading, and derating factors for multi-standard compliance. This calculator features an interactive interface with advanced visualizations. IEC 61537 and IEC 60364 require evaluating tray dimensions based on cable quantity, type, and layout configuration. For example, the weight of a steel tray will differ significantly from the weight of an aluminum tray, given the vast difference in density. Cable tray size calculation is important for ensuring safe cable installation, proper heat dissipation, and enough spare capacity for future expansion.
