

Carrier of Optical Transport Network

Overview

ITU-T defines an optical transport network as a set of optical network elements (ONE) connected by optical fiber links, able to provide functionality of transport, multiplexing, switching, management, supervision and survivability of optical channels carrying client signals. OverviewAn optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. This creates an optical for each client signal. At a very high level, the typical signals processed by OTN equipment at the Optical Channel layer are: • SONET/SDH • Ethernet/FibreChannel • Packets. • - Details of all OTN areas including breakdown of the full frame Anritsu Poster - Details of all OTN areas including breakdown of the full frame at the Wayback Machine (archived 2014-05-17)•.
