

# Core Access Layer 2 Switch

## Overview

The layer 2 switches prevent over-crowding of data packets in transmission links and access devices. Distribution Layer: The distribution layer is an intermediate layer. Introduction: The Hierarchical Network Model In today's complex IT environments, network design follows a structured approach to ensure. The term campus LAN refers to a LAN network that spans a single geographic location, such as a building or university campus. An enterprise network is a large network that may contain several campus networks spanning different. In enterprise networking, the hierarchical three-tier model is divided into three distinct roles: access switches (which connect end-user devices to the network via Layer 2), distribution switches (which route inter-VLAN traffic and enforce security policies at Layer 3), and core switches (which. Function: Connection point for all devices on a segment of segment of a network that breaks down and absorbs the data flow between all of the connected devices rather than flooding it to all connected devices.
