

Does the nitrogen generator have an explosion-proof electrical distribution box

Overview

The electrical control box has the explosion-proof mark ExdeIBT5, and the protection level is IP56; 3. Petrochemicals: Mostly require Class II. A nitrogen generator is an industrial system that produces nitrogen gas on-site by separating it from the surrounding air. Ordinary air is about 78% nitrogen and 21% oxygen, with small amounts of other gases. While nitrogen is abundant in the atmosphere, it cannot always be used directly in. Explosion-proof PSA nitrogen generators are mostly used in chemical, petroleum, natural gas and other fields; this type of nitrogen generator needs to deal with flammable and explosive environments, so in design, explosion-proof will be used for motors, electrical control, and nitrogen generators. As part of a programme of harmonization of industry standards, the Asia Industrial Gases Association (AIGA) has issued this publication 060, Safe Installation and Operation of PSA and Membrane Oxygen and Nitrogen Generators, jointly produced by members of the Inter-national Harmonisation Council. Think of nitrogen as the “safety blanket” of power generation. They should be weather-proof, & transportable.
