

Fiber Optic Cable Test Factors

Overview

Fibre attenuation, bandwidth (for multimode), and macro-bend loss are measured according to IEC 60793 (fibre-level) and correlated with IEC 60794 (cable-level) requirements. Fiber optic testing of a newly installed system not only verifies that the system meets its design requirements, but also creates a performance baseline for all future testing and troubleshooting of the system. As the components like fiber, connectors, splices, LED or laser sources, detectors and receivers are being developed, testing confirms their performance specifications and helps. Optical Loss Test Sets (OLTS): This method measures the total light loss in a fiber optic link, simulating the network conditions. Optical Time-Domain Reflectometer (OTDR): OTDR testing involves sending pulses of light down the fiber to detect faults, bends, and splice losses by analyzing the light. HOLIGHT Fiber Optic applies standardized testing procedures across its passive fiber-optic components to support reliable telecom engineering practices. Visual. We offer full-service OEM and ODM solutions for fiber optic cables, assemblies, and connectivity products — from design and prototyping to global production and logistics.
