

Fiber optic cable splice has weld marks

Overview

Too thick welding and thicker joints are often caused by too much fiber feed and too fast push; shrinkage of fusion joints and thinner joints are generally caused by insufficient feed in and too strong discharge arc. This guide reveals the secrets to fusion splicing with little fluff—just proven, straightforward techniques refined from years of work in the field. Whether it's from misalignment, dust contamination, environmental stress, or poor splice protection, these problems can quickly escalate if not. There are two basic categories of splices: Mechanical and Fusion. Mechanical fibers clamp two fibers into alignment with index matching gel between them to reduce loss and reflectance. It is necessary to clean the optical fibers before performing fusion splicing operations; another case is that the. Fiber splicing is a method of connecting two fibers, whereby two fibers are precisely cleaved and then aligned and fused using a fusion splicing machine. The fusion of two fibers is achieved by an electric arc that essentially welds the fibers together.
