

Fireproof sealing of overhead cable trays

Overview

When cable trays pass through walls or floors, seal openings using fire-rated penetration sealing materials. Do not modify or damage the tray coating or structure during use. The proper coating and acceptance of fireproof cable trays are essential for long-term performance and safety. 7 products are successfully used to protect cables in high-rise buildings, industrial buildings, and offshore facilities as well as in sensitive areas, such as hospitals, airports, production. This document outlines the key requirements for cable tray layout, installation, and fireproofing in industrial and commercial environments. Route Planning and Layout Principles Coordinate with Building Structure: Cable tray routing should align with architectural design, avoiding unnecessary. Scope: Firestopping for busway, cable trays, cables, and trunking passing through walls in enclosed electrical installations. These systems prevent fire and smoke from spreading through open cable pathways, maintaining circuit integrity and code. AF BAGS are intumescent and ablative fireproof pillows certified under EN 1366-3 for sealing up to EI 240 of cable tray penetrations.
