

Frameless cable tray material

Overview

Most cable tray systems are fabricated from a corrosion-resistant metal (low-carbon steel, stainless steel or an aluminium alloy) or from a metal with a corrosion-resistant finish (zinc or epoxy). The selection of material and finish is a function of the environment in which it is used. Cable trays are used in a wide range of environments, and easily formable (Appendices II and III). Aluminum's exceptional corrosion resistance, particularly in outdoor applications, is well known. All illustrations, descriptions and technical information included in this document are provided as indications and can cable trays are equivalent. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned. There are several types of cable trays, including ladder, perforated, solid bottom, basket, and channel trays. These materials perform very well at ambient temperatures (0°F to 100°F). However, once the confines of these temperatures have been exceeded, the materials start to react differently. We also offer a range of cable ladder systems for heavier cable support.
