

Function of 1550 Optical Module

Overview

Operating at a wavelength near 1550 nanometers, it enables high-speed data transmission across single-mode fiber (SMF), especially suited for long-reach applications such as metro or WAN environments. This blog explores what a 1550nm transceiver is, its Gigabit Ethernet 1000BASE-ZX and Fiber Channel 1x SM-LC-L FC-PI. It is with the SFP 20-pin connector to allow hot plug capability. This module is designed for single mode fiber and operates at a nominal wavelength of 1550nm. The receiver section uses an integrated InGaAs. Among these, the 1550nm optical transmitter stands out as a key technology due to its efficiency, reliability, and ability to support large bandwidths over vast distances. 1310nm SFP operates at a wavelength of 1310 nanometers and is typically used for shorter distance transmission. 10G-SFP-ZR is a kind of optical module that supports 10Gbps rate and transmission distance of 80KM, which can send data to you from 80KM away, and the delay of data transmission is almost negligible in the process.
