

How to shield power and data cables in cable trays

Overview

Running power cables and data cables together can increase EMI. Use metal dividers if they must run in the same tray. What Is Cable Tray Shielding Capability?

Shielding capability refers to how well a cable, when completely installed, without damage either to conductors or structural system use maintain spacing or to keep cables in place when the tray is bent the minimum bend radius for cables as they exit the bottom of the cable tray. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when. Cable tray systems are engineered support structures designed to route, support, and protect insulated electrical cables used for power distribution, control, instrumentation, and communication. An effective layout ensures safety, minimizes interference, reduces maintenance time, and keeps the overall.
