

How to test fiber optic networks

Overview

The three standard methods for testing fiber optic cabling are a visible light source, power meter and light source, and optical time domain reflectometer (OTDR). These fibers are most commonly made of glass and are very thin, typically less than a tenth of the width of a human hair. Why Does Fiber Optic Testing Matter?

Fiber internet offers better speed and performance than copper options, but the cables are very sensitive to bending, contamination, and physical. In this tech tip, we'll cover what fiber connectivity actually is, why testing matters more than ever, and how to troubleshoot the most common fiber optic problems before they impact your network.
