

Inspection cycle of office building electrical distribution boxes

Overview

The SFG20 44-07 standard requires specific 6-monthly checks that include visual inspections for physical damage, verification of proper labelling, checking protective devices, identifying overheating issues, and ensuring overall functionality of distribution boards. HSE and other organisations have produced guidance on electrical safety that is suitable for a wide range of industries and technical competencies. Ensuring the safe running of electrical infrastructure at industrial and building sites depends extensively on electrical safety inspections. For. Premier Technical Services Group Ltd (PTSG) has identified a significant compliance gap affecting many facilities management companies and building operators across the UK. The issue concerns SFG20 44-07 requirements for distribution board maintenance, which are often overlooked in standard. Insulation failure may occur when the cables or equipment are affected by heat or dampness, causing currents to track across the live phases resulting in high temperatures being produced which can lead to fires and/or injury. Inspect circuit breakers for proper operation. Ensure all connections are tight and secure. Look for any signs of burnt or damaged wiring.
