

Is an integrated recessed light better or a separate power supply

Overview

Integrated LED fixtures offer superior energy efficiency because the entire unit is optimized to minimize power loss between the driver and the chips. In an integrated LED light, the LED chips and arrays are built directly into the fixture. Integrated LED lights offer the same reliable lighting as traditional. The driver is a specialized power supply that converts the alternating current (AC) from your home's wiring into the low-voltage direct current (DC) that the LED chips require to produce light. Since the driver and the chips are engineered together, the fixture can be optimized for performance and. This means that when the diodes fail (which will happen - LEDs may last a long time but they don't run forever), rather than it being a simple task of unscrewing a bulb and screwing a new one, the whole fixture has to be replaced. LEDs require a constant power source to ensure that they light up stably and efficiently. But why is this necessary?

The integration serves several purposes.
