

New type of optical attenuator for supercomputing centers

Overview

Attenuation accuracy, speed, range and other indicators have been comprehensively upgraded. The new attenuator has a built-in power meter for closed-loop monitoring of output power and supports multiple operating modes, perfectly adapting to the application scenario of testing. In this guide, we'll explain what attenuators do, where to use them in data centers, and how to select the right model for your network. What Is a Fiber Attenuator?

A fiber attenuator is a passive optical device that reduces the power level of an optical signal without distorting the waveform. The datacom optical component market will grow over 60% to exceed \$16 billion in revenue during 2025, driven primarily by continued growth in 400G and 800G shipments. The new attenuator has a built-in power. As AI computing power and hyperscale data centers evolve at breakneck speed, the demand for optical interconnect solutions has entered a new phase—characterized by the triple challenges of higher bandwidth, higher density, and lower power consumption. So, how did we get here and what does the future look like?

Optical communication has the.
