

Poor signal strength of fiber optic router through walls

Overview

Boosting your WiFi signal through walls requires a combination of understanding the impact of building materials, optimizing your router's placement, and using advanced solutions like mesh network systems and powerline adapters. The interference comes from appliances that generate radio waves in a similar frequency. However, unless your walls are made of paper, the signal will almost always be affected to a degree. 4GHz, 5GHz, and 6GHz bands, explaining their attenuation levels and practical implications for indoor wireless performance. Higher frequency bands attenuate more; 6GHz has the worst penetration; reinforced concrete blocks. Test signal strength room by room to identify dead zones, using simple speed tests or Wi-Fi analyzer apps. Your first thought when facing connectivity issues might be to change the WiFi brand or router you're using.
