

Relay Protection and Automatic Safety Device Manufacturers

Overview

An example of a Safety Relay is an emergency stop pushbutton switch. This system has a safety function in which the contactor opens and closes the motor circuit upon actuation of the switch. If the emergency stop pushbutton is pressed while the motor is running, the motor stops immediately. The emergency stop pushbutton switch uses NC (normally closed). The forced guiding contact structure is characterized by a structure that detects abnormal conditions when "if the a contact is welded, all b contacts have a contact gap of 0.5mm or more when the coil is OFF" and "if the b contact is welded, all a contacts have a contact gap of 0.5mm or more when the coil is ON. The structure is characterized by its. Relay circuit actuation mechanisms include the aforementioned forced guide mechanism and direct circuit actuation mechanism. The direct circuit operating mechanism is a mechanism that pulls the NC contacts of the safety switch apart by the force acting on the actuator when the contacts are welded together. The forced guiding mechanism prevents the N.
