

Role of the upper-layer machine of the core switch

Overview

They operate at the data link layer (Layer 2) or the network layer (Layer 3) of the OSI (Open Systems Interconnection) model, facilitating the communication of devices on a network by receiving, processing, and forwarding data to the target device. A core switch is a high-capacity, high-performance Layer 3 switch positioned at the physical backbone of an enterprise network. The primary transmission and routing of data signals take place at the core layer only. It's responsible for accurately routing communication among layers and departments of different sections. Positioned at the top of the three-layer network architecture, it functions like a senior management team in an organization, tasked primarily with efficiently. A core switch in networking serves as the high-capacity backbone, centralizing data flow and ensuring efficient communication between different network segments. Simply put, it's the kingpin that keeps your network humming.
