

Routine tests for relay protection include

Overview

- Routine factory production tests to check for defects during manufacturing. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards. Acceptance tests fall into two categories : (i) On new relays which are to be used for the first time. (ii) On relay types which. Primary injection testing takes it one step further by passing actual fault currents through the entire protection chain—current transformers, the relay, and the breaker trip coil. The disadvantage is that. Acceptance testing, commissioning, and startup will include control power tests, current transformer and potential transformer tests, and any other device testing associated with the protective relay. - Commissioning tests. Protective circuit functional testing, including lockout relay testing, must take place immediately upon installation, every 2 years thereafter, and upon any change in wiring.
