

Should the network cabinet be grounded

Overview

Server racks must be grounded to ensure electrical safety, prevent equipment damage from power surges, and mitigate electromagnetic interference (EMI). Proper grounding creates a low-resistance path (≤ 5 ohms per NEC 250). Bonding (or grounding) is a system of protective measures, which is implemented to prevent electric shocks when touching metal parts of energy-powered equipment. The whole structure consists of a metal circuit, a protect bus, and a ground wire. Network hardware is connected to PDUs and constantly. If the power cords and outlets are grounded, you're probably good. You can tie all the various grounding points together if you feel like it, but it likely won't make much practical difference. The interesting problems arise when you have shielded cables, connecting various parts of the network. While most people never see the intricate infrastructure powering these services, server rack grounding is a fundamental aspect that keeps operations running smoothly. For IT professionals and. There are two primary methods employed for grounding server racks: hardwiring and the implementation of comprehensive bonding networks.
