

Slow network speed when using optical module to electrical port adapter

Overview

You can quickly resolve SFP+ Module connectivity issues by following a systematic optical transceivers troubleshooting process. Check for common connection problems, such as link failures or modules not recognized. Inspect the sfp module and cables. I'm currently using a TP-Link AV500 Powerline adapter to connect my PC with ethernet, but I'm getting very slow speeds (20 mbps maximum). Why am I getting such a slow speed?

Is there anything I can do to fix it?

Would it fix if I buy a newer and more powerful Powerline adapter?

Thank you. The SFP+ is. The SFP+ is an enhanced version of the SFP that supports data rates up to 10 Gbps. SFP and SFP+ modules look exactly the same. An unstable power supply—due to voltage fluctuations, outages, or poor adapter quality—can disrupt signal conversion, leading to network instability. This may cause delays, packet loss, video freezes, failed.
