

# Switch Fiber Optic RX to TX

## Overview

The trans-site multimode fibres are terminated with SC jacks on patch panels from where they are patched to the corresponding switch ports. Your Fiber cabling is complete and you've inserted brand-new SFPs, cleaned the connectors, and used what looks like a perfect fiber patch cable. yet the link LEDs stay red or amber. In order to receive a working connection, the cables need to be crossed at one point to let RX point to TX and vice versa. However, like any other networking technology, fiber optics can encounter issues that disrupt communication. One of the most common problems in. How do you know you need to flip the TX/RX?

What checks can I perform?

There are no patchpanels in between, so direct link. You can easily separate LC connectors.
