

Tap to find fiber optic cable

Overview

Fiber tapping is a network tap method that extracts signal from an optical fiber without breaking the connection. Tapping of optical fiber entails diverting some of the signal being transmitted in the core of the fiber into another fiber or a detector. Fiber to the home (FTTH) systems use beam splitters to allow many users to share one backbone fiber connecting to a central office, cutting the cost. Use of surreptitious fiber tapping may be used for surveillance, particularly in jurisdictions where specific authorities are legally granted access (usually limited or conditional) to electronic equipment used in. One way to detect fiber tapping is by noting increased attenuation at the point of tapping. Some systems can detect sudden attenuation on a fiber link and will automatically raise an alarm. There are, however, countermeasures. One countermeasure of fiber tapping is, to make the intercepted data unintelligible to the thief. Another is to deploy a tap into the existing raceway, conduit, or armored cable. In this scenario, it.
