

Techniques for Polishing and Grinding Distribution Boxes

Overview

Overview of grinding with proper grit selection, pressure control, and technique. Covers diamond polishing, oxide polishing, and final polishing. Mechanical preparation is the most common method of preparing materialographic specimens for microscopic examination. Specimens can be prepared to the perfect finish, the true. Grinding should commence with the finest grit size that will establish an initially flat surface and remove the effects of sectioning within a few minutes. An abrasive grit size of 180-240 [P180-P280] is coarse enough to use on specimen surfaces sectioned by an abrasive wheel. com Our videos cover a wide range of applications including:. To ensure this, samples are ground and polished before characterisation.
