

The optical module of the switch is inserted backwards

Overview

Do not insert an optical module backwards. If an optical module cannot be completely inserted into an optical port, do not force it into the port. The upkeep and operation of the network infrastructure are directly related. Future data center deployment will benefit tremendously from the flexibility of transceivers with backward compatibility. This page will serve as a helpful guide to. For DS110DF111, it is followed by a 10G SFP optical module, but after repeated insertion and removal, the optical module cannot be used, and the link status is displayed down. Port not UP Taking 10G SFP+/XFP optical module as an example, when the optical port of the optical module can not be UP when interconnecting with other devices, it can be troubleshooted from the following five. Cause 3: The optical module is incompatible with the switch brand Solution: First check whether the optical port is on, then check whether the optical module parameters (such as wavelength, rate and transmission distance) inserted by the devices at both ends match, and whether the optical module.
