

The wiring of the three-level distribution box is aesthetically pleasing

Overview

The wiring connecting electrical components inside the box should be horizontal, vertical, neat, and aesthetically pleasing. Straight sections of wire should be smooth and straight; the bending radius for curves or corners should be no less than 6 times the outer. The primary distribution box refers to the main distribution box, typically located in the distribution room. These boxes feature bottom entry and exit cables, front-opening doors, and main busbars connected with copper strips for optimal contact. Selecting Wire Colors According to Standards. For three-phase four-wire systems used in distribution boxes, the standard wire colors must be followed: Phase A - Yellow, Phase B - Green, Phase C - Red, Neutral wire - Light Blue. The secondary box adopts an inner and outer door design, with a spray painted exterior. From there, each phase is connected to individual circuit breakers, which protect the circuits from overloading or short circuits. Let's make an example for clarity: A newly constructed residential area introduces a 10kV power line to a substation. From the transformer's low-voltage side (0. Secondary power distribution; From the primary distribution box power line to the temporary power.
