

The working principle of a machine for knocking fiber optic cables

Overview

Fiber blowing machines are devices used to install fiber optic cables in ducts and conduits. The guide maintains cable alignment along the machine's axis and prevents it from rubbing against the housing edges, preserving the cable's integrity and shape – which is especially important for delicate fiber optics. A cable blowing machine (fiber blowing machine) consists of the following components: a head that. Principle of operation of the TERMA blowing machine. The cable is pushed into the pipe using belts or drive rollers, while compressed air is forced into the pipe, creating an air cushion that reduces friction and facilitates. The installation process is influenced by local conditions, local climate, customer's existing procedures, and customer requirements. The cables are typically attached to a cable jet or a.
