

Time synchronization method for relay protection tester

Overview

Testing relays at the ends of a transmission line must include the presence of two synchronized time pulses, one at each end of the line, to generate a verifiable test result. GPS based precision clocks can provide the master time source required. Time synchronization for substations with integrated protection- and system control functions, as well as data. This detailed guide explores the best practices, challenges, methodologies, and the role of advanced data analytics in synchro-check processes, backed by insights from DataCalculus. Relay protection engineers play a vital role in maintaining the stability and safety of electric power grids. To keep an electric power distribution network in operation, power utility companies have to maintain a large quantity of protection relays and power quality recorders.
