

What does TTU mean in distribution network automation

Overview

Distribution Transformer Supervisory Terminal Unit (TTU) is used in power supply and distribution systems to monitor and control distribution transformers. Compared to FTU, TTU collects more data types. Data Transfer Unit (DTU), also known as a "data transmission unit, concentrator, converter, or repeater," typically functions as a router or gateway. It supports multiple industrial protocols (e., MQTT, IEC101, Modbus) for wired input and transmits data to remote locations via wired or wireless. FTU is a kind of intelligent terminal equipment for distribution network automation, which is mainly used in feeder automation system. It helps map real grid scenarios into a robust architecture, a realistic checklist and brand-ready component selections. DTUs are typically installed at conventional substations, outdoor small-scale substations.
