

What is the tone mark of the fiber optic cable

Overview

Here is the most important information: 864F means the cable contains 864 fibersSM means singlemode fiber250 means the fiber has a 250 micron buffer coating0. We brought the cable back to our office with the intention of opening it. OTDRs typically have a tone feature you can set up to send tone from it. Using a regular jumper / launch cable connecting the otdr to the desired port you're troubleshooting. Then once you hit the field you have something called an optical fiber identifier (OFI) to find the tone by testing loose. The fiber color code is a standardized method that assigns specific colors to fiber optic components—including outer cable jackets, individual fiber strands, and connectors—to ensure reliable identification throughout installation and maintenance. These printings are critical in identifying the cable's type, performance, and compliance with industry standards. These cables are used mainly for digital audio connections between devices.
