

What to do if there is a gap in the middle of the optical cable splice

Overview

No1 problem is dirt (on fiber or splicer's lens & groove) -Clean your fiber with isopropyl alcohol & lint-free wipe -Place the fiber into the cleaver groove -Then directly to splicer groove You must do these steps quickly so as the clean fiber don't get in touch with any. No1 problem is dirt (on fiber or splicer's lens & groove) -Clean your fiber with isopropyl alcohol & lint-free wipe -Place the fiber into the cleaver groove -Then directly to splicer groove You must do these steps quickly so as the clean fiber don't get in touch with any. Fiber splicing is one way to join two optical fibers together so the light energy from one optical fiber can be transferred to another optical fiber. A fiber splice is the permanent connection of two optical fibers. Once the two optical fibers are joined with a splice, they cannot be taken apart. While a cut or damaged fiber optic cable can temporarily take your network down, it is possible to quickly fix the cable with the right tools. There are various possibilities: Mechanical splicing means that two fiber ends are tightly held together with some mechanical means. That is usually done for permanent connections, but it. Fiber optic splicing is the process of seamlessly joining two single Splicing has a lower optical loss and back-reflection than other terminations, making it the ideal choice for maintaining signal integrity and reliability in fiber optic networks.
