

Will placing the router in a network cabinet affect the signal

Overview

It is not recommended to place your router inside a cabinet as it can lead to poor Wi-Fi signal strength and potential overheating issues. Wi-Fi coverage might feel like magic, but the underlying behavior of radio waves is governed by physics, signal attenuation models, environmental absorption rates, and antenna radiation patterns. Most connectivity problems, slow speeds, unstable ping, dead zones, originate not from hardware. The only answer is to try both locations (and other locations if possible) to determine the resulting wireless performance. Which could vary if there are other factors that come into play. Do not jump to any immediate conclusions. Such physical obstructions interfere with the WiFi signal and often result in reduced signal strength and lower data throughput, particularly in areas that. WiFi signals naturally spread outward and downward from the router, so a floor-level position sends much of that valuable signal straight into the ground where it does absolutely nothing for your devices. Your router is essentially broadcasting to your basement or crawlspace instead of reaching. Position your router in a central, open location, avoiding corners, windows, and floors, and areas with bulky furniture and objects around it.
