

Yellow fiber optic patch cord splicing method

Overview

Fusion splicing is the most common and permanent method, where two fiber ends are fused together using heat, typically from an electric arc. This method provides the lowest signal loss and is ideal for long-term or high-performance applications. This guide covers everything: what fiber optic pigtails are, how they differ from patch cords, which connector and polish type to specify, how to choose between mechanical and fusion splicing, and the real-world applications where pigtails are the right call. Either joining method must have three primary characteristics. In this guide, we cover the basics of fiber optic splicing, how to perform splicing using two different methods, and finally some best practices to perform good fiber splicing. Ensure Your Splicing Tools are Clean - #2. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting.
